Keywords: biosphere reserve, Champlain-Adirondack, diversity, governance

Abstract

The United States was an integral part of the early growth of UNESCO’s Man and the Biosphere Programme (MAB), yet changing political and social contexts have impacted the relationship between the US and MAB. Poised at the start of a new period of activity, as the US reviews its strategy on its current and future engagement with MAB, it is critical to discuss the factors that have influenced the history of US involvement in the World Network of Biosphere Reserves (WNBR) and how the US will engage in the future. For the purpose of this article, the US Biosphere Network (USBN) refers to the current recently reinvigorated network of biosphere reserves in the US. As many of the USBN sites are partially or fully mountainous ecosystems, the renewed engagement of the USBN will contribute to the conservation of some of the nation’s most prized mountain landscapes. This article provides an overview of the biosphere reserve concept and of US involvement with the intergovernmental programme. We discuss challenges facing the USBN, including relevancy and inclusion, political relations with UNESCO, and perceptions of zoning. We present examples of opportunities and strategies that have been implemented by the Champlain-Adirondack Biosphere Network in a mountain region, followed by conclusions on revisioning MAB in the US and globally for the next 50 years.

Introduction

In 1971, UNESCO established the Man and the Biosphere Programme (MAB) to integrate social and ecological dimensions of the landscape beyond traditional protected area boundaries (Ishwaran et al. 2008), the Biosphere Reserves (BRs) being one of a series of six programmes of implementation. In 2021, UNESCO’s MAB is celebrating its 50th anniversary as an “intergovernmental scientific programme that aims to establish a scientific basis for enhancing the relationship between people and their environments” (UNESCO 2020). The hallmark of MAB, the World Network of Biosphere Reserves (WNBR), now numbering 727 sites in 131 countries, including 22 transboundary sites, is well established in its efforts for “improving human livelihoods and safeguarding natural and managed ecosystems, thus promoting innovative approaches to economic development that are socially and culturally appropriate and environmentally sustainable” (UNESCO 2020).

The United States (US) was an integral part of the early growth of MAB, yet, as political and social contexts changed over time, so did the relationship between the US and MAB (Gilbert 2014). Mistrust of the United Nations and a politically polarized mistrust of science and environmental management by a substantial proportion of the US public, such as the one-third of the nation that denies human-caused climate change (Leiserowitz et al. 2019; Shear & Davenport 2020), have potentially contributed to low public awareness of MAB and the US Biosphere Network (USBN). For the purpose of this article, the USBN refers to the current network of BRs in the US. The omissions of the words Man and Reserve were intentional decisions by the US Biosphere Working Group and reflect the sentiments discussed in this article. As the US reviews its strategy on its current and future engagement with MAB, it is critical to discuss the factors that have influenced the history of US involvement in the WNBR and how the US will engage in the future. As the majority of the sites in the USBN are partially or fully mountainous ecosystems, renewed engagement of the USBN will be especially important in the conservation of some of the nation’s most prized mountain landscapes.

This article aims to address these issues by providing an overview of the BR concept and a brief history of the US involvement with the intergovernmental programme. We then discuss several challenges facing the USBN, including relevancy and inclusion, political turnover and relations with UNESCO, and perceptions of zoning. We present various opportunities and strategies that have been implemented by the Champlain-Adirondack Biosphere Network (CABN), and conclusions on revisioning the USBN and WNBR for the next 50 years.

History of US MAB Programme

Most US BRs received their designation between 1976 and 1980, with a historic high of 47 US BRs at the time of the most recent (2017) periodic review. The initial model for BRs was to preserve examples of unique ecosystems around the world, as reflected in the numerous experimental forests and biological research stations designated in the US as BRs in the early years of the programme. Prompted by a collaborative agreement between the US and Russia to jointly designate and research BRs (Franklin 1977), the WNBR expanded rapidly in the 1970s and 1980s in numerous countries. Later, the model evolved to include the current zonation system, which explicitly includes space for development activities, highlighting how MAB was
an early leader in sustainable development. Soon after the establishment of the UNESCO MAB programme, the US Department of State created a National Committee in 1974, with members coming primarily from federal and state agencies (Thomsen 2018). However, the US has had a tumultuous relationship with UNESCO: in 1974, US President Gerald Ford froze payments to UNESCO after it recognized the Palestinian Liberation Organization (Waxman 2017); and the US left UNESCO in 1983 under President Ronald Reagan.

In the mid-1990s, distrust of the United Nations within the US, along with the importance of private property and westward expansion underlying US national identity, led to the proposal of the American Sovereignty Protection Act to Congress in 1996–1997 (Shafer 2004). As Congress support waned, oversight of MAB in the US transitioned to the US Forest Service in 2000, although the agency was limited in its resources to support the programme (Thomsen 2018). The US MAB Programme was reinvigorated in 2002 with the establishment of the Biosphere Reserve Association and with the re-engagement of the US in UNESCO under President George W. Bush (UN News 2002; Thomsen 2018). However, in 2005, the US Forest Service ceased to oversee the MAB programme. At the same time, the USBN, challenged by a lack of capacity, largely became inactive until the State Department took the lead in overseeing the USBN in around 2013, and the US MAB National Committee was re-established in 2015.

UNESCO requires all members of the WNBR to carry out a periodic review to ensure that the BRs still meet the criteria for their designation. Many US BRs had never conducted a periodic review in their 40+ year histories. By 2017, 17 sites decided to withdraw from the WNBR, while two sites merged with other sites, either because they did not wish to participate in the periodic review or because they failed to meet BR criteria (Thomsen 2018). In response to a decision in 2011 of UNESCO’s Executive Board to recognize Palestine as a Member State of the Organization, the US and Israel officially withdrew from UNESCO in January 2019. The State Department intends to stay engaged as a non-member observer state on non-politicized issues, including the protection of World Heritage sites, advocating for press freedoms and promoting scientific collaboration and education (US State Department 2017). Time will tell whether this period proves different from the previous withdrawal under President Reagan; however, the US is currently not engaged in decision-making leadership within UNESCO, and public awareness of UNESCO activities on the ground in the US is low.

Currently, the USBN consists of 28 BRs. Of these 28 sites, the core areas of 14 are managed by the National Park Service (NPS); the remaining 14 are managed by a mix of the NPS, US Forest Service, National Ocean and Atmospheric Administration, US Department of Agriculture, Nature Conservancy, universities, and other state and local entities. Some of the 28 sites have actively used their BR designation to achieve their landscape conservation goals and to coordinate stakeholder interests related to sustainable development. Meanwhile, other BRs that have additional designations (e.g. National Park, World Heritage Site) may not rely as heavily on the BR designation. Each of the sites in the USBN is unique, and they utilize their designation in diverse ways.

The NPS and the US MAB National Committee led the effort to conduct periodic reviews between 2016 to 2019. Over recent years, with the dissolution of this Committee as an advisory body to the US National Commission to UNESCO, a US Biosphere Working Group has been established that includes representatives from the active BRs in the USBN and others that work closely with those sites. In 2022, the Working Group is conducting a workshop for the USBN and has conducted several virtual meetings leading up to the workshop to support training, capacity and collaboration across the USBN. A Steering Committee was recently established that will provide leadership for the USBN and the Working Group. Through these efforts, the USBN is reinvigorating its activity and strategically planning for the future to overcome challenges and maximize opportunities.

USBN challenges

Relevancy and inclusion

UNESCO describes MAB as promoting “innovative approaches to economic development that are socially and culturally appropriate and environmentally sustainable” (UNESCO 2020). Further, BRs aim to be “sites for testing interdisciplinary approaches to understanding and managing changes and interactions between social and ecological systems, including conflict prevention and management of biodiversity” (UNESCO 2020). We would like to underscore the following key terms in these statements: “socially and culturally appropriate” and “interactions between social and ecological systems, including conflict prevention”. Over the past 50 years, the US and the rest of the world have changed rapidly, both socially and environmentally (Steffen et al. 2011); they will continue this trajectory of change over the next 50 years as the US becomes more diverse (Frey 2019), and there is greater interaction between humans and the environment (Tilman & Clark 2014).

While MAB considers the roles and needs of humans holistically in its vision and mission, there is room for improvement for diversity and inclusion in the USBN. The environmental movement in the US has been dominated by white voices and perspectives, largely excluding or not acknowledging the diverse interactions between different ethnicities and the environment (Finney 2014; Zimring 2017). Similarly, the US Biosphere Working Group along with past oversight committees included but a limited number of other perspectives, especially those of marginalized groups, despite UNESCO’s reference to be socially
and culturally appropriate. Many indigenous groups may view BRs as being similar to other protected areas that have a long history of displacing indigenous people and limiting their use of the land (Spence 1996; Jacoby 2014). Indigenous communities are impacted by BRs at the local level in diverse ways. For example, indigenous populations from a BR in Mexico experienced negative impacts due to BR regulations, which limited their hunting and gathering, and created perceptions of their being illegitimate resource users, while indigenous communities in a Bolivian BR perceived a lack of enforcement of logging regulations by outside settlers as a threat to their local livelihoods (Ruiz-Mallén et al. 2015, p. 102). Over the past year, the systemic racism that exists throughout US society has been brought to the forefront of our cultural public discourse (Medina 2020; Worland 2020). It is a critical element for the USBN to consider as it enters its next fifty years, in order to ensure that all stakeholders are integrated and engaged.

Gender is another element for MAB to consider in the context of a diverse and changing society. While MAB aims to be inclusive of all humans, the use of Man in the title is problematic, even if 50 years ago it was intended to denote mankind. In 2021, Man is not an acceptable word to indicate all people. Concerns have been raised about the programme’s name and calls have been made to make it more inclusive, including at public fora such as the 3rd World Congress of Biosphere Reserves, Madrid, 2008 (Gaines, personal communications); yet, concerns exist that if the name is changed, the historical foundation of the MAB programme and its identity may be lost. Over the past fifty years, there have been major strides in the US and elsewhere to empower gender diversity and LGBTQ rights (CNN 2020). Despite the MAB programme being nominally inclusive of gender diversity, the name itself may deter or exclude many members of society – at the least making the programme appear archaic and exclusive. There are other recent examples of major sports teams and businesses changing their names and brands to be more socially relevant and appropriate (Taylor 2020). For the US context, where MAB is making strides to reinvigorate itself and be relevant to a public that is largely unfamiliar with the programme, any new name should be a particularly important signifier for the inclusivity of the programme.

Lastly, as MAB celebrates its fifty years as an established programme, there is a need to consider how age factors into the next generation of the USBN. Many of the foundational leaders of the historic US MAB programme and individual BRs are no longer actively involved. While these leaders provide institutional knowledge, there is a need to create a bridge and engage with young professionals and youth to ensure relevance and long-term sustainability of the programme (Reed 2016). There has been great momentum for youth involvement in the climate change crisis and other environmental movements around the world (Neuman & Chappell 2019; Sengupta 2019). However, due to minimal recognition of MAB among US citizens and a lack of funding to formalize a youth network, engaging young professionals has proven to be a challenge for USBN leaders. The MAB Programme established a Youth Forum in 2017 in Italy, and a subsequent Forum in 2019 in China to which the USBN sent a number of representatives. Additionally, the National Park Service, universities and non-profit organizations have created innovative educational opportunities across the USBN to engage young people aged 18–35 to support the UN’s 17 sustainable development goals and MAB’s core objectives. However, without a strong identity, MAB could eventually be phased out in the US as other large landscape and transboundary initiatives continue to emerge and establish themselves alongside our well-known national parks.

Limited capacity of USBN

When the US MAB Programme was established in 1974, it included several protected areas that were federally managed and did not require significant changes in operations and management (Franklin 1977). However, a UNESCO MAB Task Force also emphasized that “The planning and establishment of biosphere reserves will require expert staff and, in some instances, considerable financial resources for buildings, communication and other facilities” (UNESCO 1974, p. 36). Although the planning, establishment and periodic review of BRs require considerable financial resources and time, the day-to-day operations of most USBN sites are largely grassroots-driven, staffed by volunteers or partner organizations, and lack dedicated or consistent funding. This discrepancy between management expectations and the local reality creates considerable challenges in establishing and maintaining active and recognized BRs in the US.

Considering the political, social and financial context that the USBN faces at the federal level, numerous USBN sites have turned to local grassroots efforts, volunteer staff and locally sourced funds to remain active. For example, Mammoth Cave BR and Cascade Head BR have agreements with local and regional partners to increase the BR’s and their partners’ capacities. This model of operation and governance structure create considerable obstacles in ensuring the long-term sustainability of the USBN, since participation and stakeholder engagement fluctuate because of inconsistent funding and the availability of non-paid volunteers.

Zoning and reserves

Effective zoning of areas where there are conflicting land uses, as in buffer areas, is recognized as critical to protect biodiversity and to ensure the preservation of a protected area (Rotich 2012; Gao et al. 2019). Although it has been nearly a century since the US Supreme Court affirmed that zoning was a valid use of governmental powers (Jacobs 1998), it is another regulatory power viewed sceptically by some sectors of the
Case study: how the Champlain-Adirondack Biosphere Network navigated challenges and maximized opportunities

Case background

Established in 1989, the Champlain-Adirondack Biosphere Network (CABN) is a mountainous trans-boundary USBN site encompassing 3990000 ha in north central New York state and northwestern Vermont (Bibles 1995). The CABN includes the Adirondack State Park (2.4 million ha; in New York), Camel's Hump Mountain and Mount Mansfield State Natural Areas (3704 ha; both in Vermont), and a portion of the Green Mountain National Forest (7462 ha; also in Vermont). Since CABN was established, it has faced significant challenges related to zoning, land sovereignty, lack of engagement, and governance capacity. When CABN received the UNESCO designation in 1989, the situation became politically fraught as very few local communities and government officials were aware that the region had been nominated by the US Department of State for BR status (Houseal 2016). Once citizens and local officials learned of the designation in the early 1990s, there was significant opposition, particularly on the New York side, stemming from fears that the United Nations would implement additional zoning restrictions and land use regulations on top of the existing regulations imposed by local land use management agencies (Houseal 2016). As a result, CABN failed to launch. It was listed as inactive by UNESCO in 1995, and remained inactive until it was notified that it might be de-listed if a periodic review was not completed in 2016 (Houseal 2016). In 2016, CABN submitted the periodic review and convened a group of key officials from New York and Vermont, together with directors of Canada’s Frontenac Arch Biosphere Network (FABN), to assess the feasibility of reinvigorating CABN’s biosphere status. From 2016 to 2020, CABN formed a Steering Committee, developed a Strategic Plan, and began a phased approach to engage the local community, with a more inclusive strategy that aimed to counter the restrictive narrative that had prohibited CABN from gaining stakeholder buy-in when it received the designation.

As the CABN shifted out of dormancy, the Steering Committee aimed to establish CABN as a network of networks that promoted bioregional strategies to bridge the gap between New York and Vermont, and to support organizations in the biosphere which were actively addressing the United Nation’s Sustainable Development Goals. The Committee also saw an opportunity to act as an aggregator and connector of interdisciplinary research and projects across the region to link otherwise disparate efforts. Furthermore, relaunching CABN presented a unique opportunity for thought leaders in the region to bring...
Partnering with the Frontenac Arch Biosphere Network

In an effort to overcome their politically fraught past and to create a new image, CABN leaders turned to neighbouring FABN in Brockville, Ontario to understand best practices in stakeholder engagement, messaging, and how to use the designation to address competing stakeholder interests. In October 2019, CABN and FABN formalized their international partnership by signing a Twinning Agreement that focused on supporting UNESCO BR core objectives with a bioregional approach in the US and Canada. CABN and FABN have a strong sense of shared place, with numerous ecological, cultural, social and economic connections with each other. In particular, they are linked by their common position on the geological formation known as the Frontenac Axis, and on the Great Lakes and Saint Lawrence River Watershed.

In order to dispel negative connotations associated with the word *reserve* and to communicate a more inclusive collaboration of partnerships, the Frontenac Arch Biosphere Reserve changed its name to biosphere network. After consulting with FABN, UNESCO and their Steering Committee, CABN followed suit in 2019 and officially changed its name to the Champlain-Adirondack Biosphere Network, to create a more inclusive message and to more accurately reflect the mission of CABN.

Engaging with indigenous populations and diverse partners for bioregional thinking

CABN and FABN also sought increased engagement and reconciliation with indigenous peoples. The Twinning Agreement seeks to incorporate indigenous people’s traditional ecological knowledge into management actions. In October 2019, FABN partnered with the Indigenous Environmental Institute at Trent University, Ontario Nature, Plenty Canada and the Walpole Island Land Trust to host a three-day event to share insights into, and strategies addressing, the interconnected crises of climate change and biodiversity loss. Over 100 leaders from Indigenous and non-Indigenous communities attended the event to support collaboration and resilience in an era of climate change.

The partnership with Lake Champlain Basin Program (LCBP) had a significant role in CABN’s engagement at the bioregional scale by including Indigenous partners. LCBP works in collaboration with government agencies from Vermont, New York and Quebec, non-profit organizations and local communities to support bioregional strategies for healthy ecosystems and communities of the Lake Champlain watershed. It oversees the Champlain Valley National Heritage Partnership (CVNHP), most of which is in the CABN and includes the ancestral home of the Iroquois and Algonquin peoples. The CVNHP provides an opportunity for CABN to promote, preserve and interpret the history of this region and to highlight the traditional ecological knowledge that shaped its landscape. LCBP and CVNHP’s guidance and support have allowed CABN to establish a network of networks around the Lake Champlain Basin and to further strengthen their transboundary collaborations.

Mentoring the next generation of biosphere leaders

The size and scope of the CABN provided a unique opportunity for educators and practitioners in the region to mentor the next generation of leaders. Recognizing the growing need to engage young people in this effort, educators from several universities in the CABN launched youth leadership mentoring programmes that focus on BR studies and sustainable development. Paul Smith’s College’s Protected Landscapes and Community Sustainability Program launched an interdisciplinary programme that also involves CABN, Appenino Tosco Emiliano BR (Italy), Cape West Coast BR (South Africa), and Dreamcatchers Tourism South Africa. This initiative gives undergraduate students the opportunity to study sustainable tourism in BRs in Italy or South Africa, and to assess how local governments implement the United Nation’s Sustainable Development Goals. The international collaboration helps to empower the next generation of WBFR leaders through hands-on experiential learning projects that can be adapted to a variety of landscapes and cultures.

In 2020, the State University of New York’s School of Environmental Science and Forestry (SUNY-ESF) launched a Center for UNESCO BR Studies to educate and engage college students in local and international MAB initiatives (Carter 2020). The primary objectives of the centre are (1) to support CABN operations; (2) to organize collaborative education and research activities; (3) to analyse the operations of international UNESCO-designated BRs to determine best practices, and (4) to support the interdisciplinary study of BRs at SUNY-ESF. These innovative programmes serve as a model for youth engagement and education in BRs worldwide.

Conclusions and recommendations

The USBN has evolved over recent decades, influenced by a variety of social, political and environmental factors. While the USBN has made strides in achieving UNESCO’s MAB goals over the past fifty years, it has also been faced with challenges that will
influence USBN going into the future. Many of the challenges outlined in this article are not specific to the US and should be considered by the WNBR. The CABN case study offers an example of how a unit in the USBN adapted to these challenges; however, there are numerous other examples from USBN and WNBR. The following recommendations outline some key strategies and considerations for the USBN. Many of them are actively under discussion, and are also relevant to the WNBR.

1. Rename the MAB programme with a more gender-inclusive title. Reflecting the current focus of the programme, the name could be the UNESCO Biosphere Programme.

2. Replace Biosphere, Reserve and Zone in individual site names with more regionally appropriate, locally acceptable, terms that align with land use while still maintaining the sites’ functionality.

3. Develop inclusive approaches to bring under-represented groups and indigenous communities to discussions about resource management at the local level of the BR, and at the national level for strategic planning and policy development.

4. Ensure that youth and young professionals are included at the centre of decision making and that their active engagement is maintained.

5. Continue to engage with educational institutions at the heart of the USBN as an inclusive thinking and learning network.

6. Develop a community of practice across BRs through workshops and virtual meetings within countries and across WNBR regional networks.

7. Re-image USBN to reflect the relevance and necessity of BRs in addressing complex social-ecological challenges such as climate change, and encourage the use of biospheres as long-term research sites. Develop a database of key research and information related to the WNBR to synthesize social science, natural science and traditional ecological knowledge. Reinforce existing connections to research networks such as the Long-Term Ecological Research sites and Local and Indigenous Knowledge Systems.

8. Assess how USBN complements other designations such as National Park, World Heritage Site and large landscape initiatives, to better align goals and actions.

9. Create a governance structure of key representatives from individual units, federal and state agencies and other key groups to maintain institutional knowledge and support over time. Develop an interactive portal to enhance capacity, establish best practices, and inform sound governance as a nested approach for the USBN, regional MAB networks, and the WNBR.

UNESCO’s MAB programme served as a catalyst for thinking beyond the traditional protected area model and emphasizing the integrated nature of landscapes as social-ecological systems. While the WNBR still maintains a unique niche in sustainable development and conservation, there are numerous examples around the world of sustainable large-landscape conservation approaches (Keeley et al. 2019). Our society is constantly changing along with the environment; thus, it is critical for the WNBR to consider the challenges and opportunities outlined in this article if it is to remain relevant, inclusive and resilient. It is our hope that this article will generate meaningful discussion within the USBN and the international MAB community, and encourage being proactive rather than reactive to changes that transcend political and institutional boundaries. Many of the issues discussed in this article are not unique to the US; they should be considered for the WNBR as a whole.
